Waffle Charts, Word Clouds, and Regression Plots

Estimated time needed: **40** minutes

Objectives

After completing this lab you will be able to:

- Create Word cloud and Waffle charts
- Create regression plots with Seaborn library

Table of Contents

Import Libraries

In [ ]:
```
#!pip install matplotlib, pandas

%matplotlib inline

import matplotlib as mpl
import matplotlib.pyplot as plt
import matplotlib.patches as mpatches # needed for waffle Charts

mpl.style.use('ggplot') # optional: for ggplot-like style

#Import Primary Modules:
import numpy as np  # useful for many scientific computing in Python
import pandas as pd # primary data structure library
from PIL import Image # converting images into arrays

#install seaborn and wordcloud
#!pip install seaborn wordcloud

#import seaborn
import seaborn as sns

#import wordcloud
import wordcloud

# check for latest version of Matplotlib and seaborn
print ('Matplotlib version: ', mpl.__version__) # >= 2.0.0
print('Seaborn version: ', sns.__version__)
print('WordCloud version: ', wordcloud.__version__)
```

Fetching Data

Toolkits: The course heavily relies on *pandas* and *Numpy* for data wrangling, analysis, and visualization. The primary plotting library we will explore in the course is Matplotlib.

Dataset: Immigration to Canada from 1980 to 2013 - International migration flows to and from selected countries - The 2015 revision from United Nation's website

The dataset contains annual data on the flows of international migrants as recorded by the countries of destination. The data presents both inflows and outflows according to the place of birth, citizenship or place of previous / next residence both for foreigners and nationals.

In this lab, we will focus on the Canadian Immigration data and use the *already cleaned dataset*.

You can refer to the lab on data pre-processing wherein this dataset is cleaned for a quick refresh your Panads skill Data pre-processing with Pandas

Download the Canadian Immigration dataset and read it into a *pandas* dataframe.

In [5]:
```
df_can = pd.read_csv('https://cf-courses-data.s3.us.cloud-object-storage.appdomain.cloud/IBMDeveloperSkillsNetwork-DV0101EN-SkillsNetwork/Data%20Files/Canada.c

print('Data read into a pandas dataframe!')
```

```
Data read into a pandas dataframe!
```

Let's take a look at the first five items in our dataset

In [6]:
```
df_can.head()
```

Out[6]:

	Country	Continent	Region	DevName	1980	1981	1982	1983	1984	1985	...	2005	2006	2007	2008	2009	2010	2011	2012	2013	Total
0	Afghanistan	Asia	Southern Asia	Developing regions	16	39	39	47	71	340	...	3436	3009	2652	2111	1746	1758	2203	2635	2004	58639
1	Albania	Europe	Southern Europe	Developed regions	1	0	0	0	0	0	...	1223	856	702	560	716	561	539	620	603	15699
2	Algeria	Africa	Northern Africa	Developing regions	80	67	71	69	63	44	...	3626	4807	3623	4005	5393	4752	4325	3774	4331	69439
3	American Samoa	Oceania	Polynesia	Developing regions	0	1	0	0	0	0	...	0	1	0	0	0	0	0	0	0	6
4	Andorra	Europe	Southern Europe	Developed regions	0	0	0	0	0	0	...	0	1	1	0	0	0	0	1	1	15

5 rows × 39 columns

Let's find out how many entries there are in our dataset

In [7]:
```
# print the dimensions of the dataframe
print(df_can.shape)
```

```
(195, 39)
```

In [8]:
```
#set Country as index
df_can.set_index('Country', inplace=True)
```

Waffle Charts

A `waffle chart` is an interesting visualization that is normally created to display progress toward goals. It is commonly an effective option when you are trying to add interesting visualization features to a visual that consists mainly of cells, such as an Excel dashboard.

Let's revisit the previous case study about Denmark, Norway, and Sweden.

In [9]:
```
# let's create a new dataframe for these three countries
df_dsn = df_can.loc[['Denmark', 'Norway', 'Sweden'], :]

# let's take a look at our dataframe
df_dsn
```

Out[9]:

Country	Continent	Region	DevName	1980	1981	1982	1983	1984	1985	1986	...	2005	2006	2007	2008	2009	2010	2011	2012	2013	Total
Denmark	Europe	Northern Europe	Developed regions	272	293	299	106	93	73	93	...	62	101	97	108	81	92	93	94	81	3901
Norway	Europe	Northern Europe	Developed regions	116	77	106	51	31	54	56	...	57	53	73	66	75	46	49	53	59	2327
Sweden	Europe	Northern Europe	Developed regions	281	308	222	176	128	158	187	...	205	139	193	165	167	159	134	140	140	5866

3 rows × 38 columns

Unfortunately, unlike R, `waffle` charts are not built into any of the Python visualization libraries. Therefore, we will learn how to create them from scratch.

Step 1. The first step into creating a waffle chart is determing the proportion of each category with respect to the total.

In [10]:
```
# compute the proportion of each category with respect to the total
total_values = df_dsn['Total'].sum()
category_proportions = df_dsn['Total'] / total_values

# print out proportions
pd.DataFrame({"Category Proportion": category_proportions})
```

Out[10]:

Country	Category Proportion
Denmark	0.322557
Norway	0.192409
Sweden	0.485034

Step 2. The second step is defining the overall size of the `waffle` chart.

In [11]:
```
width = 40 # width of chart
height = 10 # height of chart

total_num_tiles = width * height # total number of tiles

print(f'Total number of tiles is {total_num_tiles}.')
```

```
Total number of tiles is 400.
```

Step 3. The third step is using the proportion of each category to determe it respective number of tiles

In [12]:
```
# compute the number of tiles for each category
tiles_per_category = (category_proportions * total_num_tiles).round().astype(int)

# print out number of tiles per category
pd.DataFrame({"Number of tiles": tiles_per_category})
```

Out[12]:

Country	Number of tiles
Denmark	129
Norway	77
Sweden	194

Based on the calculated proportions, Denmark will occupy 129 tiles of the `waffle` chart, Norway will occupy 77 tiles, and Sweden will occupy 194 tiles.

Step 4. The fourth step is creating a matrix that resembles the `waffle` chart and populating it.

In [13]:
```
# initialize the waffle chart as an empty matrix
waffle_chart = np.zeros((height, width), dtype = np.uint)

# define indices to loop through waffle chart
category_index = 0
tile_index = 0

# populate the waffle chart
for col in range(width):
    for row in range(height):
        tile_index += 1

        # if the number of tiles populated for the current category is equal to its corresponding allocated tiles...
        if tile_index > sum(tiles_per_category[0:category_index]):
            # ...proceed to the next category
            category_index += 1

        # set the class value to an integer, which increases with class
        waffle_chart[row, col] = category_index

print ('Waffle chart populated!')
```

```
Waffle chart populated!
```

Let's take a peek at how the matrix looks like.

In [14]:
```
waffle_chart
```

Out[14]:
```
array([[1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 2, 2, 2, 2, 2, 2, 2, 2, 3,
        3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3],
       [1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 2, 2, 2, 2, 2, 2, 2, 2, 3,
        3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3],
       [1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 2, 2, 2, 2, 2, 2, 2, 2, 3,
        3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3],
       [1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 2, 2, 2, 2, 2, 2, 2, 2, 3,
        3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3],
       [1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 2, 2, 2, 2, 2, 2, 2, 2, 3,
        3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3],
       [1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 2, 2, 2, 2, 2, 2, 2, 2, 3,
        3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3],
       [1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 2, 2, 2, 2, 2, 2, 2, 3, 3,
        3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3],
       [1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 2, 2, 2, 2, 2, 2, 2, 3, 3,
        3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3],
       [1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 2, 2, 2, 2, 2, 2, 2, 3, 3,
        3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3],
       [1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 2, 2, 2, 2, 2, 2, 2, 2, 3, 3,
        3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3, 3]],
      dtype=uint64)
```

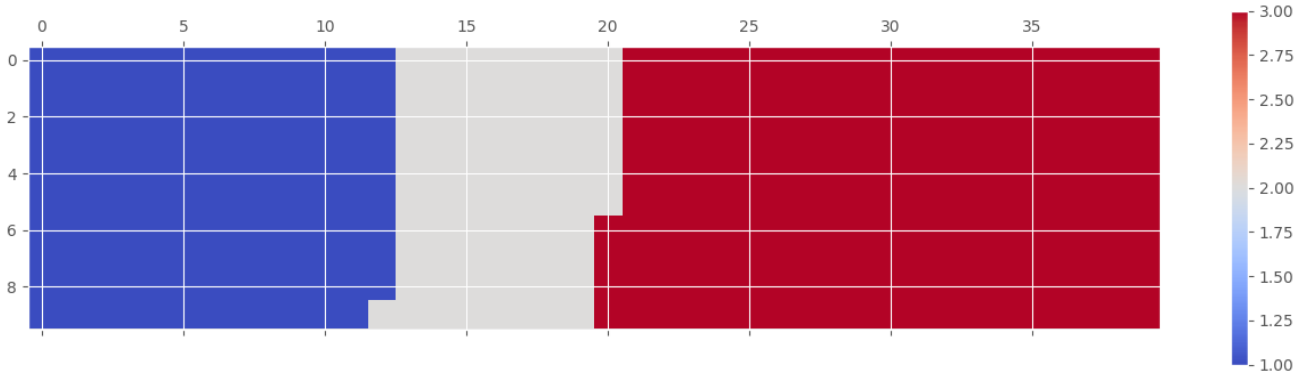
As expected, the matrix consists of three categories and the total number of each category's instances matches the total number of tiles allocated to each category.

Step 5. Map the `waffle` chart matrix into a visual.

In [15]:
```
# instantiate a new figure object
fig = plt.figure()

# use matshow to display the waffle chart
colormap = plt.cm.coolwarm
plt.matshow(waffle_chart, cmap=colormap)
plt.colorbar()
plt.show()
```

```
<Figure size 640x480 with 0 Axes>
```



Step 6. Prettify the chart.

In [16]:
```
# instantiate a new figure object
fig = plt.figure()

# use matshow to display the waffle chart
colormap = plt.cm.coolwarm
plt.matshow(waffle_chart, cmap=colormap)
plt.colorbar()

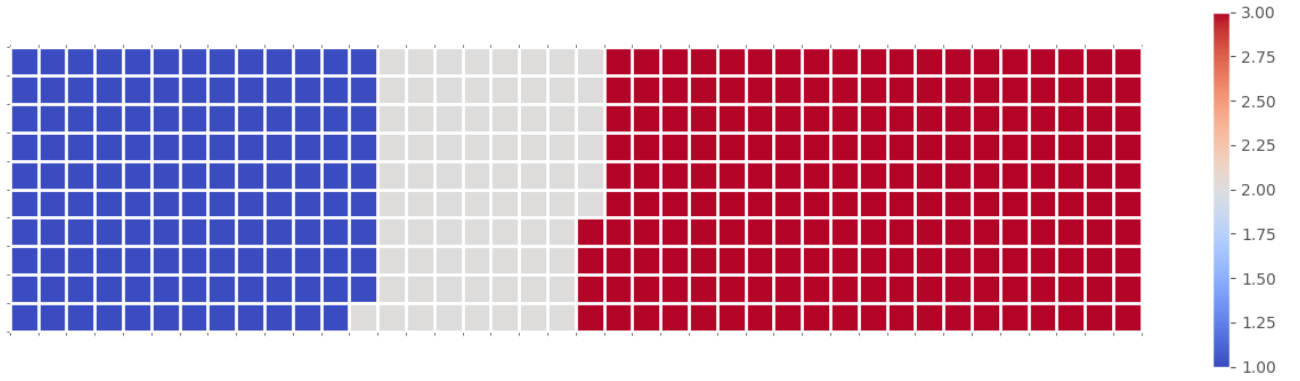
# get the axis
ax = plt.gca()

# set minor ticks
ax.set_xticks(np.arange(-.5, (width), 1), minor=True)
ax.set_yticks(np.arange(-.5, (height), 1), minor=True)

# add gridlines based on minor ticks
ax.grid(which='minor', color='w', linestyle='-', linewidth=2)

plt.xticks([])
plt.yticks([])
plt.show()
```

```
<Figure size 640x480 with 0 Axes>
```



Step 7. Create a legend and add it to chart.

In [17]:
```
# instantiate a new figure object
fig = plt.figure()

# use matshow to display the waffle chart
colormap = plt.cm.coolwarm
plt.matshow(waffle_chart, cmap=colormap)
plt.colorbar()

# get the axis
ax = plt.gca()

# set minor ticks
ax.set_xticks(np.arange(-.5, (width), 1), minor=True)
ax.set_yticks(np.arange(-.5, (height), 1), minor=True)

# add gridlines based on minor ticks
ax.grid(which='minor', color='w', linestyle='-', linewidth=2)

plt.xticks([])
plt.yticks([])

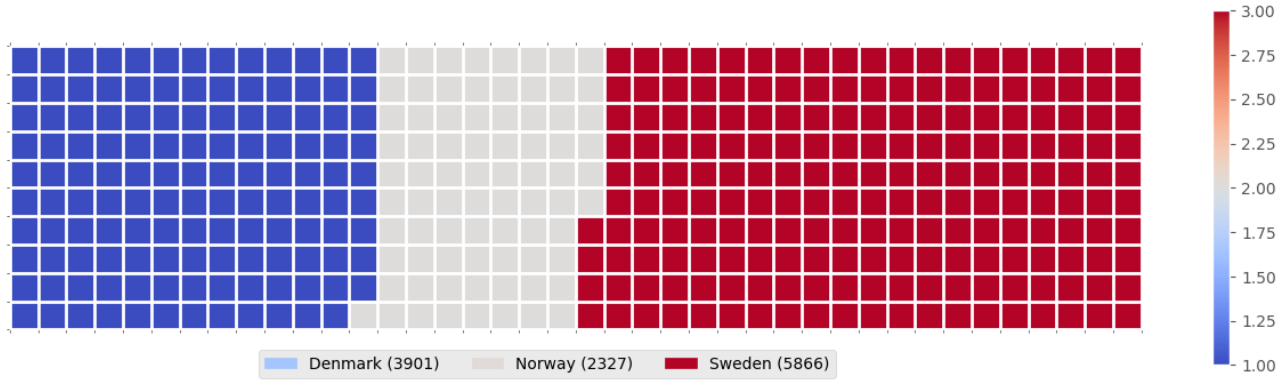
# compute cumulative sum of individual categories to match color schemes between chart and legend
values_cumsum = np.cumsum(df_dsn['Total'])
total_values = values_cumsum[len(values_cumsum) - 1]

# create legend
legend_handles = []
for i, category in enumerate(df_dsn.index.values):
    label_str = category + ' (' + str(df_dsn['Total'][i]) + ')'
```

```
    color_val = colormap(float(values_cumsum[i])/total_values)
    legend_handles.append(mpatches.Patch(color=color_val, label=label_str))

# add legend to chart
plt.legend(handles=legend_handles,
           loc='lower center',
           ncol=len(df_dsn.index.values),
           bbox_to_anchor=(0., -0.2, 0.95, .1)
          )
plt.show()
```

```
/tmp/ipykernel_80/2463873726.py:24: FutureWarning: Series.__getitem__ treating keys as positions is deprecated. In a future version, integer keys will always be
treated as labels (consistent with DataFrame behavior). To access a value by position, use `ser.iloc[pos]`
  total_values = values_cumsum[len(values_cumsum) - 1]
/tmp/ipykernel_80/2463873726.py:29: FutureWarning: Series.__getitem__ treating keys as positions is deprecated. In a future version, integer keys will always be
treated as labels (consistent with DataFrame behavior). To access a value by position, use `ser.iloc[pos]`
  label_str = category + ' (' + str(df_dsn['Total'][i]) + ')'
/tmp/ipykernel_80/2463873726.py:30: FutureWarning: Series.__getitem__ treating keys as positions is deprecated. In a future version, integer keys will always be
treated as labels (consistent with DataFrame behavior). To access a value by position, use `ser.iloc[pos]`
  color_val = colormap(float(values_cumsum[i])/total_values)
<Figure size 640x480 with 0 Axes>
```



And there you go! What a good looking *delicious* `waffle` chart, don't you think?

Now it would very inefficient to repeat these seven steps every time we wish to create a `waffle` chart. So let's combine all seven steps into one function called *create_waffle_chart*. This function would take the following parameters as input:

> 1. **categories**: Unique categories or classes in dataframe.
> 2. **values**: Values corresponding to categories or classes.
> 3. **height**: Defined height of waffle chart.
> 4. **width**: Defined width of waffle chart.
> 5. **colormap**: Colormap class
> 6. **value_sign**: In order to make our function more generalizable, we will add this parameter to address signs that could be associated with a value such as %, $, and so on. **value_sign** has a default value of empty string.

In [18]:
```
def create_waffle_chart(categories, values, height, width, colormap, value_sign=''):

    # compute the proportion of each category with respect to the total
    total_values = sum(values)
    category_proportions = [(float(value) / total_values) for value in values]

    # compute the total number of tiles
    total_num_tiles = width * height # total number of tiles
    print ('Total number of tiles is', total_num_tiles)

    # compute the number of tiles for each catagory
    tiles_per_category = [round(proportion * total_num_tiles) for proportion in category_proportions]

    # print out number of tiles per category
    for i, tiles in enumerate(tiles_per_category):
        print (df_dsn.index.values[i] + ': ' + str(tiles))

    # initialize the waffle chart as an empty matrix
    waffle_chart = np.zeros((height, width))

    # define indices to loop through waffle chart
    category_index = 0
    tile_index = 0

    # populate the waffle chart
    for col in range(width):
        for row in range(height):
            tile_index += 1

            # if the number of tiles populated for the current category
            # is equal to its corresponding allocated tiles...
            if tile_index > sum(tiles_per_category[0:category_index]):
                # ...proceed to the next category
                category_index += 1

            # set the class value to an integer, which increases with class
            waffle_chart[row, col] = category_index

    # instantiate a new figure object
    fig = plt.figure()
```

```
    # use matshow to display the waffle chart
    colormap = plt.cm.coolwarm
    plt.matshow(waffle_chart, cmap=colormap)
    plt.colorbar()

    # get the axis
    ax = plt.gca()

    # set minor ticks
    ax.set_xticks(np.arange(-.5, (width), 1), minor=True)
    ax.set_yticks(np.arange(-.5, (height), 1), minor=True)

    # add dridlines based on minor ticks
    ax.grid(which='minor', color='w', linestyle='-', linewidth=2)

    plt.xticks([])
    plt.yticks([])

    # compute cumulative sum of individual categories to match color schemes between chart and legend
    values_cumsum = np.cumsum(values)
    total_values = values_cumsum[len(values_cumsum) - 1]

    # create legend
    legend_handles = []
    for i, category in enumerate(categories):
        if value_sign == '%':
            label_str = category + ' (' + str(values[i]) + value_sign + ')'
        else:
            label_str = category + ' (' + value_sign + str(values[i]) + ')'

        color_val = colormap(float(values_cumsum[i])/total_values)
        legend_handles.append(mpatches.Patch(color=color_val, label=label_str))

    # add legend to chart
    plt.legend(
        handles=legend_handles,
        loc='lower center',
        ncol=len(categories),
        bbox_to_anchor=(0., -0.2, 0.95, .1)
    )
    plt.show()
```

Now to create a `waffle` chart, all we have to do is call the function `create_waffle_chart`. Let's define the input parameters:

In [19]:
```
width = 40 # width of chart
height = 10 # height of chart

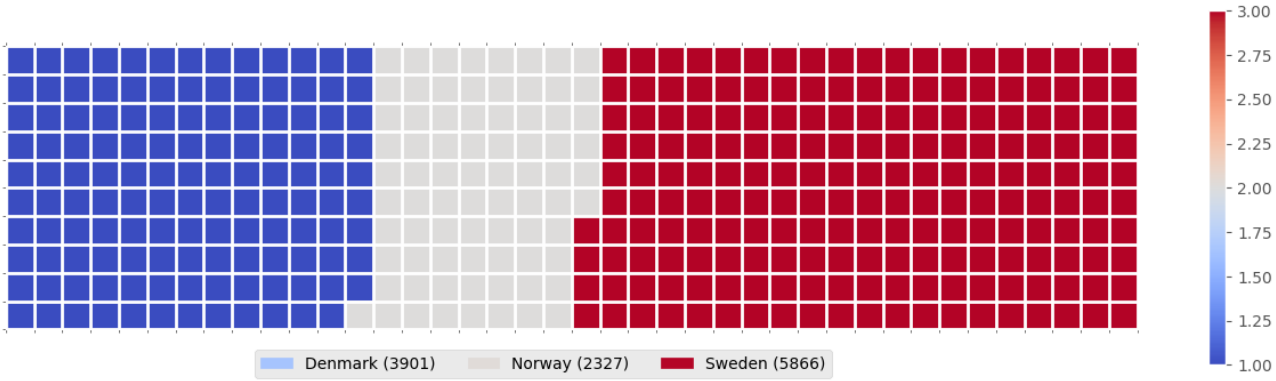
categories = df_dsn.index.values # categories
values = df_dsn['Total'] # correponding values of categories

colormap = plt.cm.coolwarm # color map class
```

And now let's call our function to create a `waffle` chart.

In [20]:
```
create_waffle_chart(categories, values, height, width, colormap)
```

```
Total number of tiles is 400
Denmark: 129
Norway: 77
Sweden: 194
/tmp/ipykernel_80/3286913405.py:62: FutureWarning: Series.__getitem__ treating keys as positions is deprecated. In a future version, integer keys will always be treated as labels (consistent with DataFrame behavior). To access a value by position, use `ser.iloc[pos]`
  total_values = values_cumsum[len(values_cumsum) - 1]
/tmp/ipykernel_80/3286913405.py:70: FutureWarning: Series.__getitem__ treating keys as positions is deprecated. In a future version, integer keys will always be treated as labels (consistent with DataFrame behavior). To access a value by position, use `ser.iloc[pos]`
  label_str = category + ' (' + value_sign + str(values[i]) + ')'
/tmp/ipykernel_80/3286913405.py:72: FutureWarning: Series.__getitem__ treating keys as positions is deprecated. In a future version, integer keys will always be treated as labels (consistent with DataFrame behavior). To access a value by position, use `ser.iloc[pos]`
  color_val = colormap(float(values_cumsum[i])/total_values)
<Figure size 640x480 with 0 Axes>
```



There seems to be a new Python package for generating `waffle charts` called PyWaffle,

Let's create the same waffle chart with **pywaffle** now

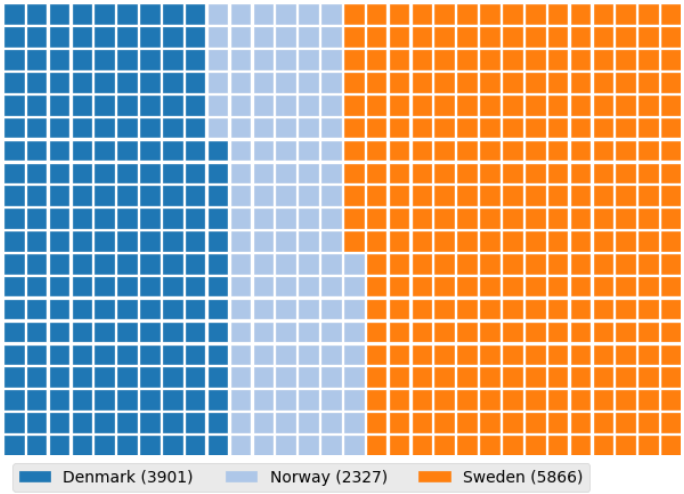
In [ ]:
```
#install pywaffle
!pip install pywaffle
```

In [22]:
```
#import Waffle from pywaffle
from pywaffle import Waffle

#Set up the Waffle chart figure

fig = plt.figure(FigureClass = Waffle,
                 rows = 20, columns = 30, #pass the number of rows and columns for the waffle
                 values = df_dsn['Total'], #pass the data to be used for display
                 cmap_name = 'tab20', #color scheme
                 legend = {'labels': [f"{k} ({v})" for k, v in zip(df_dsn.index.values,df_dsn.Total)],
                           'loc': 'lower left', 'bbox_to_anchor':(0,-0.1),'ncol': 3}
                 #notice the use of list comprehension for creating labels
                 #from index and total of the dataset
                )

#Display the waffle chart
plt.show()
```



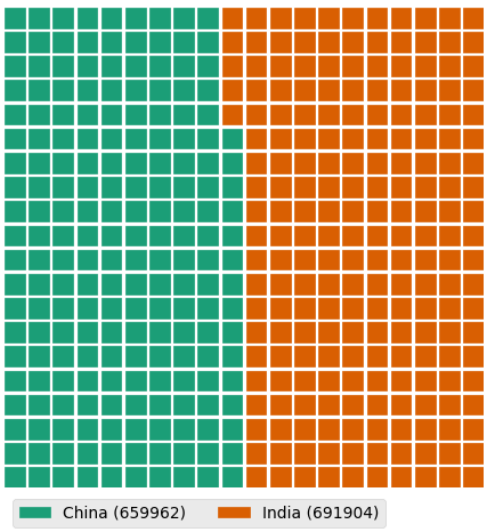
Question: Create a Waffle chart to dispaly the proportiona of China and Inida total immigrant contribution.

In [32]:
```
from pywaffle import Waffle

df_ci = df_can.loc[['China','India'],:]

fig = plt.figure(FigureClass = Waffle,
                 rows = 20, columns = 20,
                 values = df_ci['Total'],
                 cmap_name = 'Dark2',
                 legend = {'labels': [f"{k} ({v})" for k, v in zip(df_ci.index.values,df_ci.Total)],
                           'loc': 'lower left', 'bbox_to_anchor':(0,-0.1),'ncol': 2}
                )

plt.show()
```



▸ Click here for a sample python solution

Word Clouds

`Word` clouds (also known as text clouds or tag clouds) work in a simple way: the more a specific word appears in a source of textual data (such as a speech, blog post, or database), the bigger and bolder it appears in the word cloud.

Luckily, a Python package already exists in Python for generating `word` clouds. The package, called `word_cloud` was developed by **Andreas Mueller**. You can learn more about the package by following this link.

Let's use this package to learn how to generate a word cloud for a given text document.

First, let's install the package.

In [33]:
```
#import package and its set of stopwords
from wordcloud import WordCloud, STOPWORDS

print ('Wordcloud imported!')
```

```
Wordcloud imported!
```

`Word` clouds are commonly used to perform high-level analysis and visualization of text data. Accordinly, let's digress from the immigration dataset and work with an example that involves analyzing text data. Let's try to analyze a short novel written by **Lewis Carroll** titled *Alice's Adventures in Wonderland*. Let's go ahead and download a *.txt* file of the novel.

In [34]:
```
import urllib

# # open the file and read it into a variable alice_novel
alice_novel = urllib.request.urlopen('https://cf-courses-data.s3.us.cloud-object-storage.appdomain.cloud/IBMDeveloperSkillsNetwork-DV0101EN-SkillsNetwork/Data%
```

Next, let's use the stopwords that we imported from `word_cloud` . We use the function *set* to remove any redundant stopwords.

In [35]:
```
stopwords = set(STOPWORDS)
```

Create a word cloud object and generate a word cloud. For simplicity, let's generate a word cloud using only the first 2000 words in the novel.

In [ ]:
```
#if you get attribute error while generating worldcloud, upgrade Pillow and numpy using below code
#%pip install --upgrade Pillow
#%pip install --upgrade numpy
```

In [36]:
```
# instantiate a word cloud object
alice_wc = WordCloud()

# generate the word cloud
alice_wc.generate(alice_novel)
```

Out[36]:
```
<wordcloud.wordcloud.WordCloud at 0x7f45d5795750>
```

Awesome! Now that the `word` cloud is created, let's visualize it.

In [37]:
```
# display the word cloud
plt.imshow(alice_wc, interpolation='bilinear')
plt.axis('off')
plt.show()
```

Interesting! So in the first 2000 words in the novel, the most common words are **Alice**, **said**, **little**, **Queen**, and so on. Let's resize the cloud so that we can see the less frequent words a little better.

In [38]:
```
fig = plt.figure(figsize=(14, 18))

# display the cloud
plt.imshow(alice_wc, interpolation='bilinear')
plt.axis('off')
plt.show()
```

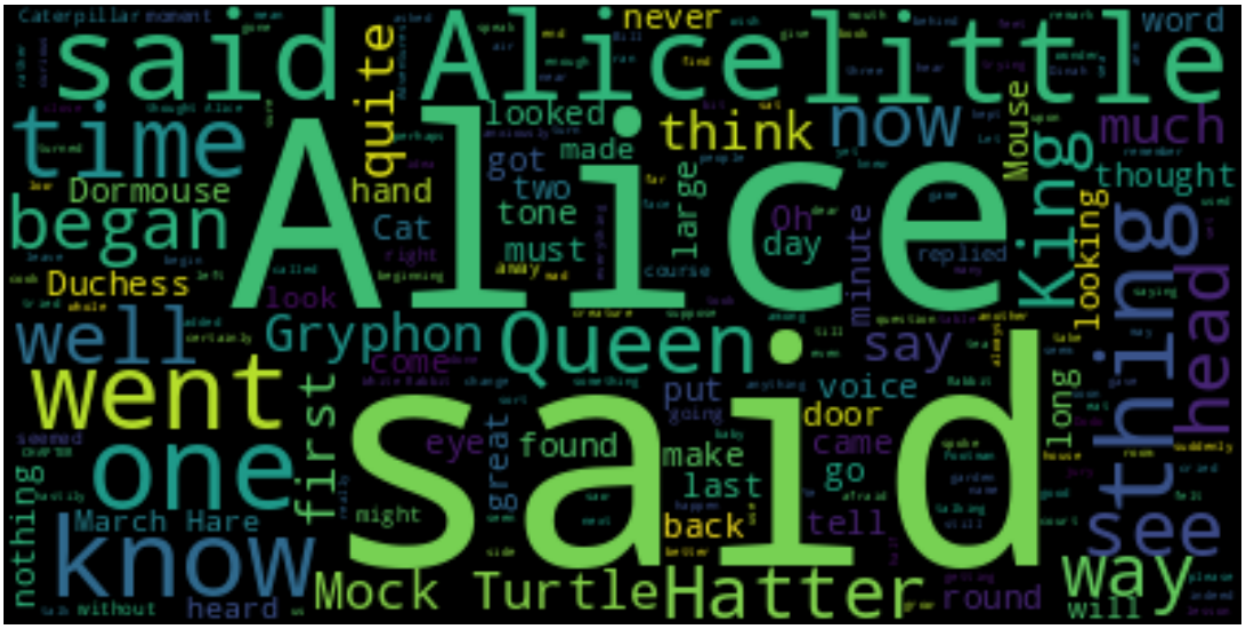
Much better! However, **said** isn't really an informative word. So let's add it to our stopwords and re-generate the cloud.

In [41]:
```
stopwords.add('said') # add the words said to stopwords

# re-generate the word cloud
alice_wc.generate(alice_novel)

# display the cloud
fig = plt.figure(figsize=(14, 18))

plt.imshow(alice_wc, interpolation='bilinear')
plt.axis('off')
plt.show()
```



Excellent! This looks really interesting! Another cool thing you can implement with the `word_cloud` package is superimposing the words onto a mask of any shape. Let's use a mask of Alice and her rabbit. We already created the mask for you, so let's go ahead and download it and call it *alice_mask.png*.

In [42]:
```
#save mask to alice_mask
alice_mask = np.array(Image.open(urllib.request.urlopen('https://cf-courses-data.s3.us.cloud-object-storage.appdomain.cloud/IBMDeveloperSkillsNetwork-DV0101EN-
```

Let's take a look at how the mask looks like.

In [43]:
```
fig = plt.figure(figsize=(14, 18))

plt.imshow(alice_mask, cmap=plt.cm.gray, interpolation='bilinear')
plt.axis('off')
plt.show()
```

Shaping the `word` cloud according to the mask is straightforward using `word_cloud` package. For simplicity, we will continue using the first 2000 words in the novel.

In [44]:
```
# instantiate a word cloud object
alice_wc = WordCloud(background_color='white', max_words=2000, mask=alice_mask, stopwords=stopwords)

# generate the word cloud
alice_wc.generate(alice_novel)

# display the word cloud
fig = plt.figure(figsize=(14, 18))

plt.imshow(alice_wc, interpolation='bilinear')
plt.axis('off')
plt.show()
```

Really impressive!

Unfortunately, our immigration data does not have any text data, but where there is a will there is a way. Let's generate sample text data from our immigration dataset, say text data of 90 words.

Let's recall how our data looks like.

In [45]:
```
df_can.head()
```

Out[45]:

Country	Continent	Region	DevName	1980	1981	1982	1983	1984	1985	1986	...	2005	2006	2007	2008	2009	2010	2011	2012	2013	Total
Afghanistan	Asia	Southern Asia	Developing regions	16	39	39	47	71	340	496	...	3436	3009	2652	2111	1746	1758	2203	2635	2004	58639
Albania	Europe	Southern Europe	Developed regions	1	0	0	0	0	0	1	...	1223	856	702	560	716	561	539	620	603	15699
Algeria	Africa	Northern Africa	Developing regions	80	67	71	69	63	44	69	...	3626	4807	3623	4005	5393	4752	4325	3774	4331	69439
American Samoa	Oceania	Polynesia	Developing regions	0	1	0	0	0	0	0	...	0	1	0	0	0	0	0	0	0	6
Andorra	Europe	Southern Europe	Developed regions	0	0	0	0	0	0	2	...	0	1	1	0	0	0	0	1	1	15

5 rows × 38 columns

And what was the total immigration from 1980 to 2013?

In [46]:
```
total_immigration = df_can['Total'].sum()
total_immigration
```

Out[46]:
```
np.int64(6409153)
```

Using countries with single-word names, let's duplicate each country's name based on how much they contribute to the total immigration.

In [47]:
```
max_words = 90
word_string = ''
for country in df_can.index.values:
     # check if country's name is a single-word name
    if country.count(" ") == 0:
        repeat_num_times = int(df_can.loc[country, 'Total'] / total_immigration * max_words)
        word_string = word_string + ((country + ' ') * repeat_num_times)

# display the generated text
word_string
```

Out[47]:
```
'China China China China China China China China China Colombia Egypt France Guyana Haiti India India India India India India India India India Jamaica Lebano
n Morocco Pakistan Pakistan Pakistan Philippines Philippines Philippines Philippines Philippines Philippines Philippines Poland Portugal Romania '
```

We are not dealing with any stopwords here, so there is no need to pass them when creating the word cloud.

In [48]:
```
# create the word cloud
wordcloud = WordCloud(background_color='white').generate(word_string)

print('Word cloud created!')
```

```
Word cloud created!
```

In [49]:
```
# display the cloud
plt.figure(figsize=(14, 18))

plt.imshow(wordcloud, interpolation='bilinear')
plt.axis('off')
plt.show()
```

According to the above word cloud, it looks like the majority of the people who immigrated came from one of 15 countries that are displayed by the word cloud. One cool visual that you could build, is perhaps using the map of Canada and a mask and superimposing the word cloud on top of the map of Canada. That would be an interesting visual to build!

Plotting with Seaborn

> Seaborn is a Python visualization library based on matplotlib. It provides a high-level interface for drawing attractive statistical graphics. You can learn more about *seaborn* by following this link and more about *seaborn* regression plots by following this link.

In lab *Pie Charts, Box Plots, Scatter Plots, and Bubble Plots*, we learned how to create a scatter plot and then fit a regression line. It took ~20 lines of code to create the scatter plot along with the regression fit. In this final section, we will explore *seaborn* and see how efficient it is to create regression lines and fits using this library!

Categorical Plots

In our data 'df_can', let's find out how many continents are mentioned

In [50]:
```
df_can['Continent'].unique()
```

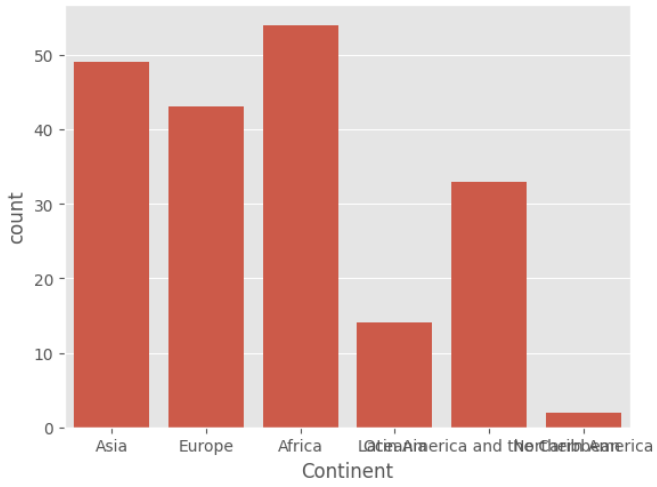
Out[50]:
```
array(['Asia', 'Europe', 'Africa', 'Oceania',
       'Latin America and the Caribbean', 'Northern America'],
      dtype=object)
```

countplot

A count plot can be thought of as a histogram across a categorical, instead of quantitative, variable. Let's find the count of Continents in the data 'df_can' using countplot on 'Continent'

In [51]:
```
sns.countplot(x='Continent', data=df_can)
```

Out[51]:
```
<Axes: xlabel='Continent', ylabel='count'>
```

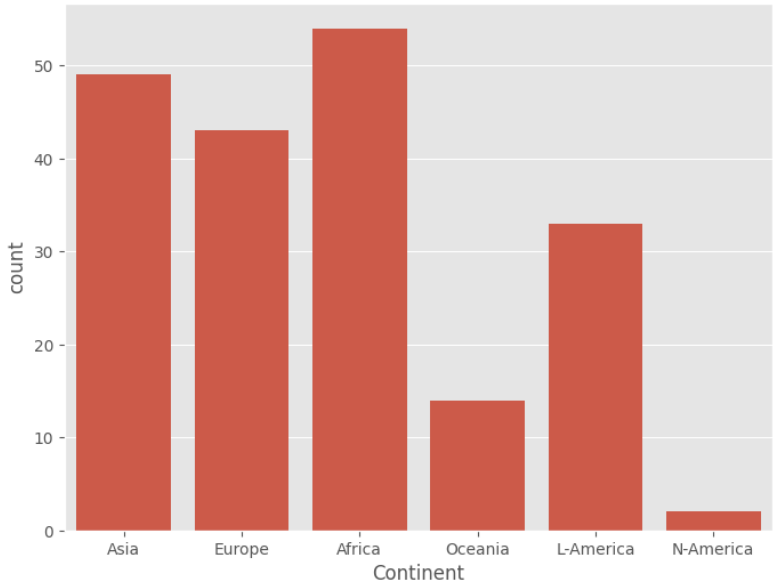


The labels on the x-axis doesnot look as expected.
Let's try to replace the 'Latin America and the Caribbean' with and "L-America", 'Northern America' with "N-America",
and change the figure size and then display the plot again

In [52]:
```
df_can1 = df_can.replace('Latin America and the Caribbean', 'L-America')
df_can1 = df_can1.replace('Northern America', 'N-America')
```

In [56]:
```
plt.figure(figsize=(8, 6))
sns.countplot(x='Continent', data=df_can1)
```

Out[56]:
```
<Axes: xlabel='Continent', ylabel='count'>
```



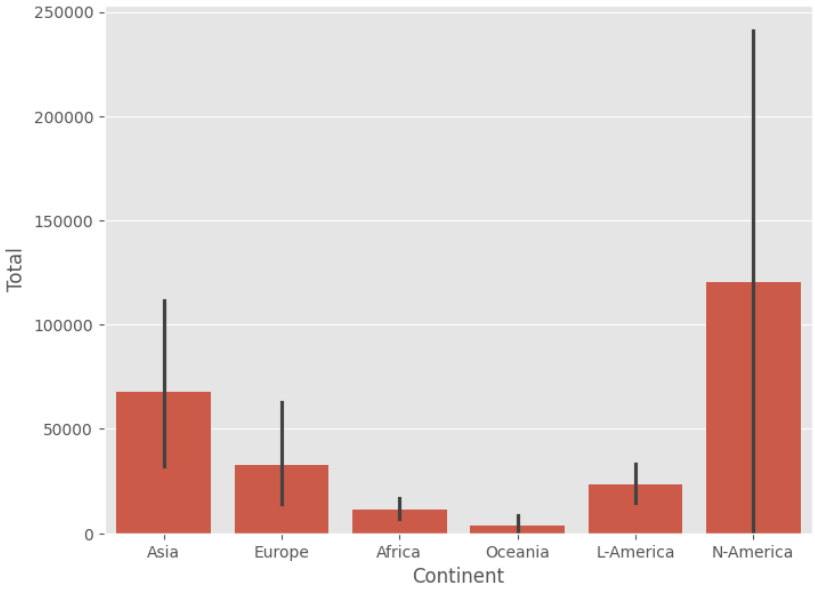
Much better!

Barplot

This plot will perform the Groupby on a categorical varaible and plot aggregated values, with confidence intervals.
Let's plot the total immigrants Continent-wise

In [57]:
```
plt.figure(figsize=(8, 6))
sns.barplot(x='Continent', y='Total', data=df_can1)
```

Out[57]:
```
<Axes: xlabel='Continent', ylabel='Total'>
```



You can verify the values by performing the groupby on the Total and Continent for mean()

In [58]:
```
df_Can2=df_can1.groupby('Continent')['Total'].mean()
df_Can2
```

Out[58]:
```
Continent
Africa        11462.000000
Asia          67710.081633
Europe        32812.720930
L-America     23186.303030
N-America    120571.000000
Oceania        3941.000000
Name: Total, dtype: float64
```

Create a new dataframe that stores that total number of landed immigrants to Canada per year from 1980 to 2013.

Regression Plot

With *seaborn*, generating a regression plot is as simple as calling the **regplot** function.

In [59]:
```
years = list(map(str, range(1980, 2014)))
# we can use the sum() method to get the total population per year
df_tot = pd.DataFrame(df_can[years].sum(axis=0))

# change the years to type float (useful for regression later on)
df_tot.index = map(float, df_tot.index)

# reset the index to put in back in as a column in the df_tot dataframe
df_tot.reset_index(inplace=True)

# rename columns
df_tot.columns = ['year', 'total']

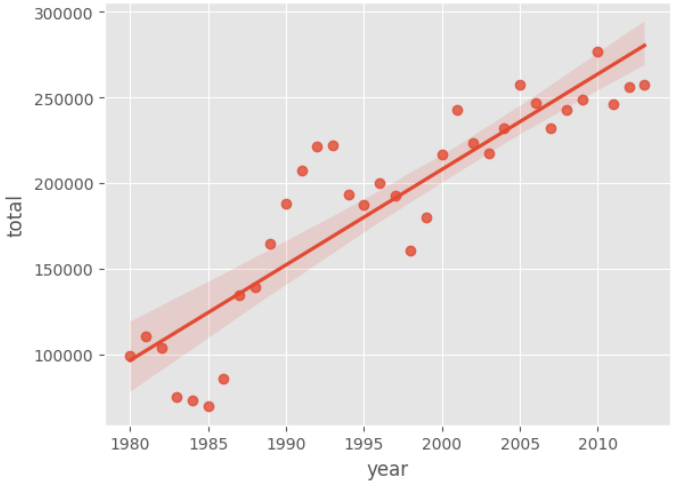
# view the final dataframe
df_tot.head()
```

Out[59]:

	year	total
0	1980.0	99137
1	1981.0	110563
2	1982.0	104271
3	1983.0	75550
4	1984.0	73417

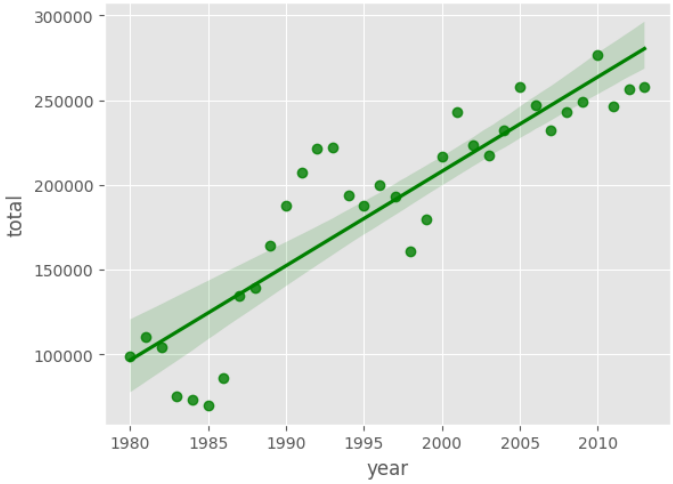
In [60]:
```
#seaborn is already imported at the start of this lab
sns.regplot(x='year', y='total', data=df_tot)
```

Out[60]:
```
<Axes: xlabel='year', ylabel='total'>
```



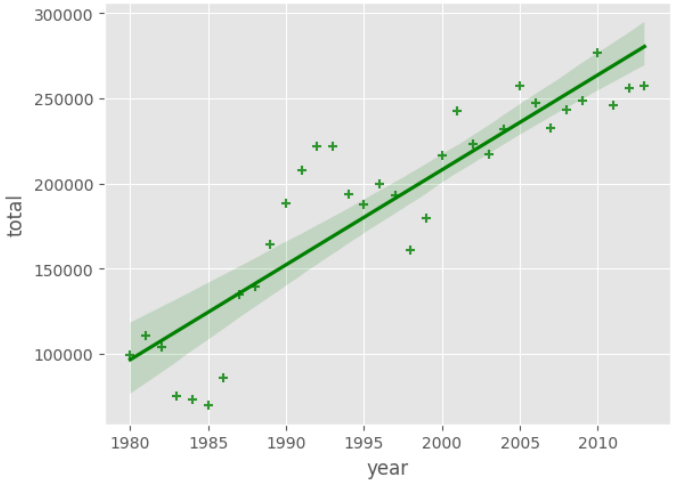
This is not magic; it is *seaborn*! You can also customize the color of the scatter plot and regression line. Let's change the color to green.

In [61]:
```
sns.regplot(x='year', y='total', data=df_tot, color='green')
plt.show()
```



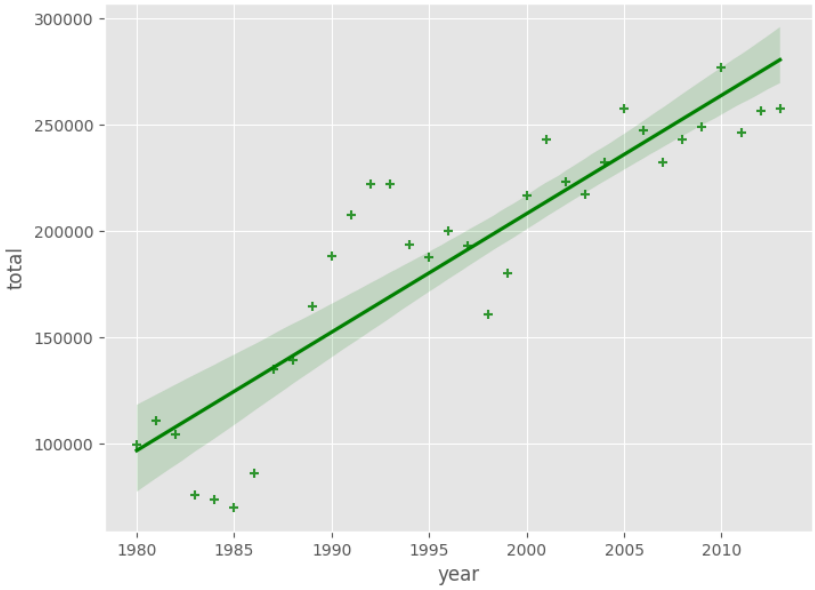
You can always customize the marker shape, so instead of circular markers, let's use `+`.

In [62]:
```
ax = sns.regplot(x='year', y='total', data=df_tot, color='green', marker='+')
plt.show()
```



Let's blow up the plot a little so that it is more appealing to the sight.

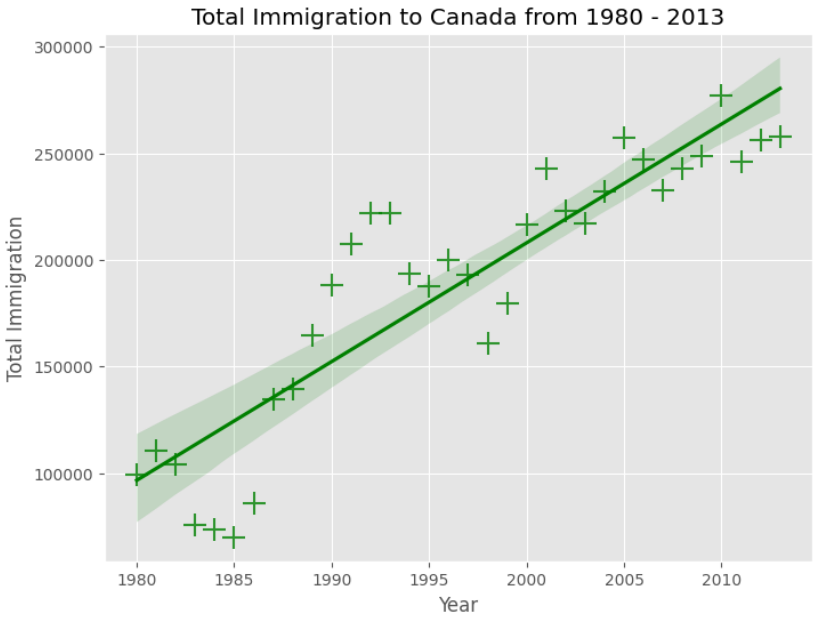
In [63]:
```
plt.figure(figsize=(8, 6))
sns.regplot(x='year', y='total', data=df_tot, color='green', marker='+')
plt.show()
```



And let's increase the size of markers so they match the new size of the figure, and add a title and x- and y-labels.

In [64]:
```
plt.figure(figsize=(8, 6))
ax = sns.regplot(x='year', y='total', data=df_tot, color='green', marker='+', scatter_kws={'s': 200})

ax.set(xlabel='Year', ylabel='Total Immigration') # add x- and y-labels
ax.set_title('Total Immigration to Canada from 1980 - 2013') # add title
plt.show()
```

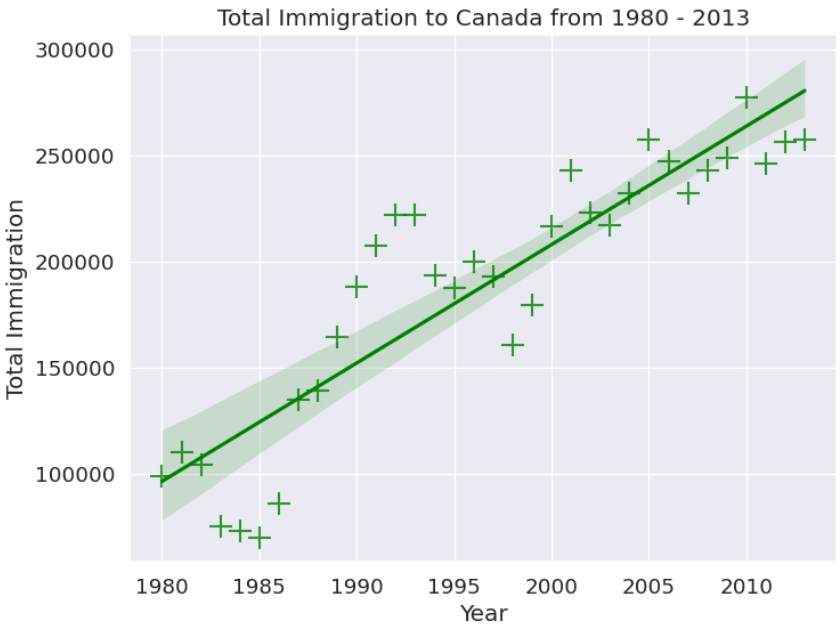


And finally increase the font size of the tickmark labels, the title, and the x- and y-labels so they don't feel left out!

In [67]:
```
plt.figure(figsize=(8, 6))

sns.set(font_scale=1.2)

ax = sns.regplot(x='year', y='total', data=df_tot, color='green', marker='+', scatter_kws={'s': 200})
ax.set(xlabel='Year', ylabel='Total Immigration')
ax.set_title('Total Immigration to Canada from 1980 - 2013')
plt.show()
```



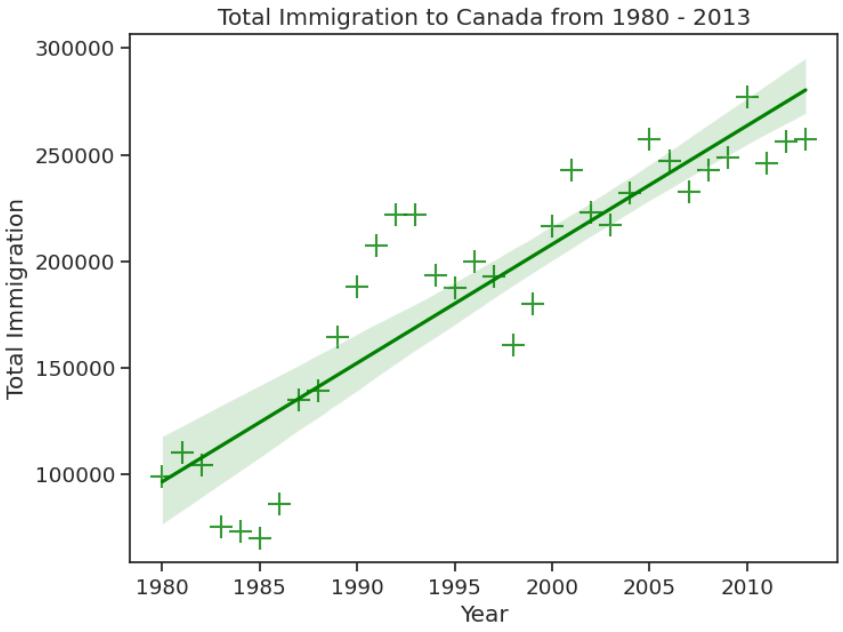
Amazing! A complete scatter plot with a regression fit with 5 lines of code only. Isn't this really amazing?

If you are not a big fan of the purple background, you can easily change the style to a white plain background.

In [68]:
```
plt.figure(figsize=(8, 6))

sns.set(font_scale=1.2)
sns.set_style('ticks')

ax = sns.regplot(x='year', y='total', data=df_tot, color='green', marker='+', scatter_kws={'s': 200})
ax.set(xlabel='Year', ylabel='Total Immigration')
ax.set_title('Total Immigration to Canada from 1980 - 2013')
plt.show()
```

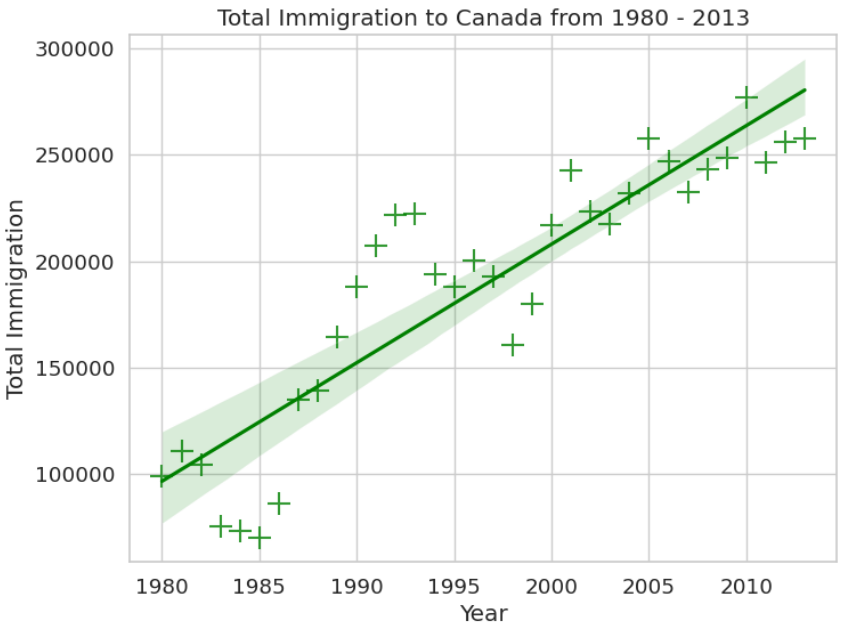


Or to a white background with gridlines.

In [70]:
```
plt.figure(figsize=(8, 6))

sns.set(font_scale=1.2)
sns.set_style('whitegrid')

ax = sns.regplot(x='year', y='total', data=df_tot, color='green', marker='+', scatter_kws={'s': 200})
ax.set(xlabel='Year', ylabel='Total Immigration')
ax.set_title('Total Immigration to Canada from 1980 - 2013')
plt.show()
```



Question: Use seaborn to create a scatter plot with a regression line to visualize the total immigration from Denmark, Sweden, and Norway to Canada from 1980 to 2013.

In [73]:
```
df_dsn = df_can.loc[['Denmark','Norway','Sweden'],years].transpose()
df_total = pd.DataFrame(df_dsn.sum(axis=1))

df_total.reset_index(inplace=True)
df_total.columns = ['year', 'total']
df_total['year'] = df_total['year'].astype(int)

plt.figure(figsize=(8, 6))

sns.set_style('whitegrid')
ax = sns.regplot(x='year', y='total', data=df_tot, color='green', marker='+')
ax.set(xlabel='Year', ylabel='Total Immigration')
ax.set_title('Total Immigration to Denmark, Norway, Sweden from 1980 - 2013')
plt.show()
```
