	j alia will	ting files	
Package/ Method	Description	Syntax and Code Example	
File opening modes	Different modes to open files for specific operations.	Syntax: r (reading) w (writing) a (appending) + (updating: read/write) b (binary, otherwise text) 1	
File reading methods	Different methods to read file content in various ways.	Syntax: 1 file.readlines() # reads all lines as a list 2 readline() # reads the next line as a string 3 file.read() # reads the entire file content as a string Example: 1 with open("data.txt", "r") as file: 2 lines = file.readlines() 3 next_line = file.readline() 4 content = file.read()	
File writing methods	Different write methods to write content to a file.	<pre>Syntax: 1 file.write(content) # writes a string to the file 2 file.writelines(lines) # writes a list of strings to the file Example: 1 lines = ["Hello\n", "World\n"] 2 with open("output.txt", "w") as file: 3 file.writelines(lines)</pre>	
Iterating over lines	Iterates through each line in the file using a `loop`.	Syntax: 1 for line in file: # Code to process each line Example: 1 with open("data.txt", "r") as file: 2 for line in file: print(line)	
Open() and close()	Opens a file, performs operations, and explicitly closes the file using the close() method.	<pre>Syntax: 1 file = open(filename, mode) # Code that uses the file 2 file.close() Example: 1 file = open("data.txt", "r") 2 content = file.read() 3 file.close()</pre>	
with open()	Opens a file using a with block, ensuring automatic file closure after usage.	with open(filename, mode) as file: # Code that uses the file Example: 1	
Pandas			
Package/ Method	Descrip	tion Syntax and Code Example	
.read_csv()	Reads d	ata from a `.CSV` file and creates a DataFrame. Syntax: dataframe name = pd.read csv("filename.csv") Example: df = pd.read csv("data.csv")	
544_654()	ricaus u	Syntax datarrane pareda_csv(menanic.csv / Example, at = pareda_csv(data.csv)	

Method .read_csv() .read_excel()	Description	Syntax and Code Example	
.read_excel()	Reads data from a `.CSV` file and creates a DataFrame.	Syntax: dataframe_name = pd.read_csv("filename.csv") Example: df = pd.read_csv("data.csv") Syntax:	
.read_excel()		<pre>dataframe_name = pd.read_excel("filename.xlsx")</pre>	4
	Reads data from an Excel file and creates a DataFrame.	Example:	
		<pre>1 df = pd.read_excel("data.xlsx")</pre>	4
		Syntax:	
		1 dataframe_name.to_csv("output.csv", index=False)	4
.to_csv()	Writes DataFrame to a CSV file.	Example:	
		<pre>1 df.to_csv("output.csv", index=False)</pre>	අු
		Syntax:	
	Accesses a specific column using [] in the DataFrame.	<pre>dataframe_name["column_name"] # Accesses single column dataframe_name[["column1", "column2"]] # Accesses multiple columns</pre>	2
Access Columns		Example:	
		1 df["age"]	
		2 df[["name", "age"]]	4
		Syntax:	
	Generates statistics summary of numeric columns in the DataFrame.	1 dataframe_name.describe()	凸
describe()		Example:	
		1 df.describe()	4
		Syntax:	
		<pre>dataframe_name.drop(["column1", "column2"], axis=1, inplace=True) dataframe_name.drop(index=[row1, row2], axis=0, inplace=True)</pre>	2
drop()	Removes specified rows or columns from the DataFrame. axis=1 indicates columns. axis=0	Example:	
	indicates rows.	<pre>1 df.drop(["age", "salary"], axis=1, inplace=True) # Will drop columns</pre>	
		df.drop(index=[5, 10], axis=0, inplace=True) # Will drop rows	2
		Syntax:	
		1 dataframe_name.dropna(axis=0, inplace=True)	එ
dropna()	Removes rows with missing NaN values from the DataFrame. axis=0 indicates rows.	Example:	
		1 df.dropna(axis=0, inplace=True)	ළු
		Syntax:	
	Duplicate or repetitive values or records within a data set.	1 dataframe_name.duplicated()	එ
duplicated()		Example:	
		<pre>duplicate_rows = df[df.duplicated()]</pre>	4
		Syntax:	
		1 filtered_df = dataframe_name[(Conditional_statements)]	අු
Filter Rows	Creates a new DataFrame with rows that meet specified conditions.	Example:	
		<pre>filtered_df = df[(df["age"] > 30) & (df["salary"] < 50000)</pre>	4
		Syntax:	
		grouped = dataframe_name.groupby(by, axis=0, level=None, as_index=True,	අු
groupby()	Splits a DataFrame into groups based on specified criteria, enabling subsequent aggregation, transformation, or analysis within each group.	<pre>2 sort=True, group_keys=True, squeeze=False, observed=False, dropna=True)</pre>	40
		Example:	
		<pre>grouped = df.groupby(["category", "region"]).agg({"sales": "sum"})</pre>	4
		Syntax:	
		1 dataframe_name.head(n)	අු
head()	Displays the first n rows of the DataFrame.	Example:	
		1 df.head(5)	470
			4
		Syntax:	
		Syntax: 1 import pandas as pd	අ
Import pandas	Imports the Pandas library with the alias pd.		
Import pandas	Imports the Pandas library with the alias pd.	1 import pandas as pd	
Import pandas	Imports the Pandas library with the alias pd.	1 import pandas as pd Example:	එ
Import pandas	Imports the Pandas library with the alias pd.	<pre>1 import pandas as pd Example: 1 import pandas as pd</pre>	අු
Import pandas info()	Imports the Pandas library with the alias pd. Provides information about the DataFrame, including data types and memory usage.	<pre>1 import pandas as pd Example: 1 import pandas as pd Syntax:</pre>	එ
		<pre>1 import pandas as pd Example: 1 import pandas as pd Syntax: 1 dataframe_name.info()</pre>	එ
		<pre>1 import pandas as pd Example: 1 import pandas as pd Syntax: 1 dataframe_name.info() Example:</pre>	අ
		<pre>1 import pandas as pd Example: 1 import pandas as pd Syntax: 1 dataframe_name.info() Example: 1 df.info()</pre>	අ
		<pre>1 import pandas as pd Example: 1 import pandas as pd Syntax: 1 dataframe_name.info() Example: 1 df.info()</pre> Syntax:	අු අු
info()	Provides information about the DataFrame, including data types and memory usage.	<pre>1 import pandas as pd Example: 1 import pandas as pd Syntax: 1 dataframe_name.info() Example: 1 df.info() Syntax: 1 merged_df = pd.merge(df1, df2, on=["column1", "column2"])</pre>	අු අු
info()	Provides information about the DataFrame, including data types and memory usage.	<pre>import pandas as pd Example: import pandas as pd Syntax: dataframe_name.info() Example: full df.info() Syntax: merged_df = pd.merge(df1, df2, on=["column1", "column2"]) Example:</pre>	අු අු
info()	Provides information about the DataFrame, including data types and memory usage.	<pre>import pandas as pd Example: import pandas as pd Syntax: dataframe_name.info() Example: function of the position of</pre>	අු අු
info()	Provides information about the DataFrame, including data types and memory usage.	<pre>import pandas as pd Example: import pandas as pd Syntax: dataframe_name.info() Example: function of the pandas as pd Syntax: merged_df = pd.merge(df1, df2, on=["column1", "column2"]) Example: merged_df = pd.merge(sales, products, on=["product_id", "category_id"]) Syntax:</pre>	අු අු අු
info() merge() print	Provides information about the DataFrame, including data types and memory usage. Merges two DataFrames based on multiple common columns.	<pre>1 import pandas as pd Example: 1 import pandas as pd Syntax: 1 dataframe_name.info() Example: 1 df.info() Syntax: 1 merged_df = pd.merge(df1, df2, on=["column1", "column2"]) Example: 1 merged_df = pd.merge(sales, products, on=["product_id", "category_id"]) Syntax: 1 print(df) # or just type df Example: 1 print(df)</pre>	අු අු අු
info() merge() print	Provides information about the DataFrame, including data types and memory usage. Merges two DataFrames based on multiple common columns.	<pre>Example: 1 import pandas as pd Syntax: 1 dataframe_name.info() Example: 1 df.info() Syntax: 1 merged_df = pd.merge(df1, df2, on=["column1", "column2"]) Example: 1 merged_df = pd.merge(sales, products, on=["product_id", "category_id"]) Syntax: 1 print(df) # or just type df Example:</pre>	අු අු අු
info() merge() print	Provides information about the DataFrame, including data types and memory usage. Merges two DataFrames based on multiple common columns.	<pre>1 import pandas as pd Example: 1 import pandas as pd Syntax: 1 dataframe_name.info() Example: 1 df.info() Syntax: 1 merged_df = pd.merge(df1, df2, on=["column1", "column2"]) Example: 1 merged_df = pd.merge(sales, products, on=["product_id", "category_id"]) Syntax: 1 print(df) # or just type df Example: 1 print(df) # or just type df Example:</pre>	අ අ අ අ
info() merge() print	Provides information about the DataFrame, including data types and memory usage. Merges two DataFrames based on multiple common columns.	Example: 1 import pandas as pd Syntax: 1 dataframe_name.info() Example: 1 df.info() Syntax: 1 merged_df = pd.merge(df1, df2, on=["column1", "column2"]) Example: 1 merged_df = pd.merge(sales, products, on=["product_id", "category_id"]) Syntax: 1 print(df) # or just type df Example: 1 print(df) 2 df Syntax: 1 dataframe_name["column_name"].replace(old_value, new_value, inplace=True)	අ අ අ අ
info() merge() print DataFrame	Provides information about the DataFrame, including data types and memory usage. Merges two DataFrames based on multiple common columns. Displays the content of the DataFrame.	Example: 1 import pandas as pd Syntax: 1 dataframe_name.info() Example: 1 df.info() Syntax: 1 merged_df = pd.merge(df1, df2, on=["column1", "column2"]) Example: 1 merged_df = pd.merge(sales, products, on=["product_id", "category_id"]) Syntax: 1 print(df) # or just type df Example: 1 print(df) 2 df Syntax: 1 dataframe_name["column_name"].replace(old_value, new_value, inplace=True) Example:	අ අ අ අ අ
info() merge() print DataFrame	Provides information about the DataFrame, including data types and memory usage. Merges two DataFrames based on multiple common columns. Displays the content of the DataFrame.	Example: 1 import pandas as pd Syntax: 1 dataframe_name.info() Example: 1 df.info() Syntax: 1 merged_df = pd.merge(df1, df2, on=["column1", "column2"]) Example: 1 merged_df = pd.merge(sales, products, on=["product_id", "category_id"]) Syntax: 1 print(df) # or just type df Example: 1 print(df) 2 df Syntax: 1 dataframe_name["column_name"].replace(old_value, new_value, inplace=True)	අ අ අ අ
info() merge() print DataFrame	Provides information about the DataFrame, including data types and memory usage. Merges two DataFrames based on multiple common columns. Displays the content of the DataFrame.	Example: 1 import pandas as pd Syntax: 1 dataframe_name.info() Example: 1 df.info() Syntax: 1 merged_df = pd.merge(df1, df2, on=["column1", "column2"]) Example: 1 merged_df = pd.merge(sales, products, on=["product_id", "category_id"]) Syntax: 1 print(df) # or just type df Example: 1 print(df) 2 df Syntax: 1 dataframe_name["column_name"].replace(old_value, new_value, inplace=True) Example: 1 df["status"].replace("In Progress", "Active", inplace=True) Syntax:	අ අ අ අ අ අ
info() merge() print DataFrame replace()	Provides information about the DataFrame, including data types and memory usage. Merges two DataFrames based on multiple common columns. Displays the content of the DataFrame. Replaces specific values in a column with new values.	Example: 1 import pandas as pd Syntax: 1 dataframe_name.info() Example: 1 df.info() Syntax: 1 merged_df = pd.merge(df1, df2, on=["column1", "column2"]) Example: 1 merged_df = pd.merge(sales, products, on=["product_id", "category_id"]) Syntax: 1 print(df) # or just type df Example: 1 print(df) 2 df Syntax: 1 dataframe_name["column_name"].replace(old_value, new_value, inplace=True) Example: 1 df["status"].replace("In Progress", "Active", inplace=True) Syntax: 1 dataframe_name.tail(n)	අ අ අ අ අ
info() merge() print DataFrame	Provides information about the DataFrame, including data types and memory usage. Merges two DataFrames based on multiple common columns. Displays the content of the DataFrame.	Example: 1 import pandas as pd Syntax: 1 dataframe_name.info() Example: 1 df.info() Syntax: 1 merged_df = pd.merge(df1, df2, on=["column1", "column2"]) Example: 1 merged_df = pd.merge(sales, products, on=["product_id", "category_id"]) Syntax: 1 print(df) # or just type df Example: 1 print(df) 2 df Syntax: 1 dataframe_name["column_name"].replace(old_value, new_value, inplace=True) Example: 1 df["status"].replace("In Progress", "Active", inplace=True) Syntax:	අ අ අ අ අ අ

Package/Method	Description	Syntax and Code Example
Importing NumPy	Imports the NumPy library.	Syntax: 1 import numpy as np Example:
		1 import numpy as np
np.array()	Creates a one or multi-dimensional array,	Syntax: 1 array_1d = np.array([list1 values]) # 1D Array 2 array_2d = np.array([[list1 values], [list2 values]]) # 2D And Example: 1 array_1d = np.array([1, 2, 3]) # 1D Array
		2 array_2d = np.array([[1, 2], [3, 4]]) # 2D Array
Numpy Array Attributes	 Calculates the mean of array elements Calculates the sum of array elements Finds the minimum value in the array Finds the maximum value in the array Computes dot product of two arrays 	Example: 1
