Cheat Sheet: API's and Data Collection

Cheat Sheet: API's and Data Collection			
Package/ Method	Description	Code Example	
Accessing element attribute	Access the value of a specific attribute of an HTML element.	<pre>Syntax: 1 attribute = element[(attribute)] Example:</pre>	42
	Parse the HTML	<pre>1 href = link_element[(href)]</pre> Syntax:	4
BeautifulSoup()	content of a web page using BeautifulSoup.	<pre>soup = BeautifulSoup(html, (html.parser)) Example:</pre>	4 2
	The parser type can vary based on the project.	<pre>1 html = (https://api.example.com/data) soup = BeautifulSoup(html, (html.parser))</pre>	4
	Send a DELETE request to remove data or	Syntax: 1 response = requests.delete(url)	අු
delete()	a resource from the server. DELETE requests delete a	Example:	
	specified resource on the server.	<pre>1 response = requests.delete((https://api.example.com/delete))</pre>	4 2
5 10	Find the first HTML element	Syntax: 1 element = soup.find(tag, attrs)	අු
find()	that matches the specified tag and attributes.	<pre>first_link = soup.find((a), {(class): (link)})</pre>	අු
	Find all HTML elements that	Syntax: 1 elements = soup.find_all(tag, attrs)	එු
find_all()	match the specified tag and attributes.	<pre>Example: 1 all_links = soup.find_all((a), {(class): (link)})</pre>	අු
		Syntax: 1	අු
findChildren()	Find all child elements of an HTML element.	Example:	Pa
	Perform a GET	1 child_elements = parent_div.findChildren()	4 2
	request to retrieve data from a specified URL. GET	Syntax:	
get()	requests are typically used for reading data	1 response = requests.get(url) Example:	4
	from an API. The response variable will contain the	<pre>1 response = requests.get((https://api.example.com/data))</pre>	අු
	server's response, which you can process further.		
	Include custom headers in the request. Headers	Syntax:	
Headers	can provide additional information to	<pre>headers = {(HeaderName): (Value)}</pre> Example:	අු
	the server, such as authentication tokens or	base_url = (https://api.example.com/data) headers = {(Authorization): (Bearer YOUR_TOKEN)} response = requests.get(base_url, headers=headers)	අු
	content types. Import the necessary	Syntax:	
Import Libraries	Python libraries for web scraping.	1 from bs4 import BeautifulSoup	අු
	Parse JSON data from the response. This		
	extracts and works with the data returned by the API. The	<pre>Syntax: 1 data = response.json()</pre>	අු
json()	response.json() method converts the	<pre>Example: 1 response = requests.get((https://api.example.com/data))</pre>	2
	JSON response into a Python data structure (usually a	<pre>data = response.json()</pre>	LEI .
	dictionary or list).	Syntax:	
next_sibling()	Find the next sibling element	<pre>1 sibling = element.find_next_sibling() Example:</pre>	අු
	in the DOM.	<pre>1 next_sibling = current_element.find_next_sibling()</pre>	අු
parent	Access the parent element in the Document	Syntax: 1 parent = element.parent Example:	අු
	Object Model (DOM).	1 parent_div = paragraph.parent	අු
	Send a POST request to a specified URL		
post()	with data. Create or update POST requests using resources on the	Syntax: 1 response = requests.post(url, data) Example:	æ
p = 500	server. The data parameter contains the	<pre>1 response = requests.post((https://api.example.com/submit), data={(key): (value)})</pre>	අු
	the server, often in JSON format.		
	Send a PUT request to update data on the server. PUT	Syntax:	
put()	requests are used to update an existing resource on the	<pre>1 response = requests.put(url, data)</pre> Example:	අ
	server with the data provided in the data	<pre>1 response = requests.put((https://api.example.com/update), data={(key): (value)})</pre>	C
	parameter, typically in JSON format.		
	Pass query parameters in the URL to filter or customize the	Syntax: 1 params = {(param_name): (value)}	අු
Query parameters	request. Query parameters specify	<pre>base_url = "https://api.example.com/data" params = {"page": 1, "per_page": 10}</pre>	
	conditions or limits for the requested data.	response = requests.get(base_url, params=params)	2
select()	Select HTML elements from the parsed	Syntax: 1 element = soup.select(selector) Example:	අු
	HTML using a CSS selector.	<pre>1 titles = soup.select((h1))</pre>	4
	Check the HTTP status code of the response.	Syntax:	
	The HTTP status code indicates the result of the request (success,	1 response.status_code Example:	අු
status_code	error, redirection). Use the HTTP status codelt can be	<pre>1 url = "https://api.example.com/data" 2 response = requests.get(url) 3 status code = response status code</pre>	2
	used for error handling and decision-making	3 status_code = response.status_code	
	Specify any valid	Tag Example: 1 - (a): Find anchor () tags.	
tage for f	HTML tag as the tag parameter to search for elements of that	- (p): Find paragraph ((p)) tags. - (h1), (h2), (h3), (h4), (h5), (h6): Find heading tags from level 1 to 6 ((h1), n (h2)). - (table): Find table () tags. - (tn): Find table pow () tags.	
tags for find() and find_all()	type. Here are some common HTML tags that you can use with	- (tr): Find table row () tags. - (td): Find table cell ((td)) tags. - (th): Find table header cell ((td))tags. - (img): Find image ((img)) tags.	
	the tag parameter.	- (form): Find form ((form)) tags. - (button): Find button ((button)) tags.	42
	Retrieve the text	Syntax: 1 text = element.text	අු

text

4

Retrieve the text

content of an

HTML element.

title_text = title_element.text

Example:
